

For my project I have created a Porfolio website. My intent with this project was to work on the basics I learned this semester. Coding is not a strength of mine, so I wanted to focus on fixing errors independently and making my code cleaner, as these have been two major issues for me.

The structure of the website is the main page then a few different pages categories my work. There is also an extra page hidden because I thought it would be a fun addition.

The colour pallet I chose was pastel. I wanted something that would appear neutral behind my work. I have also always had a love for pastels and a lot of my projects have been done in pink, so it felt only right to continue that.

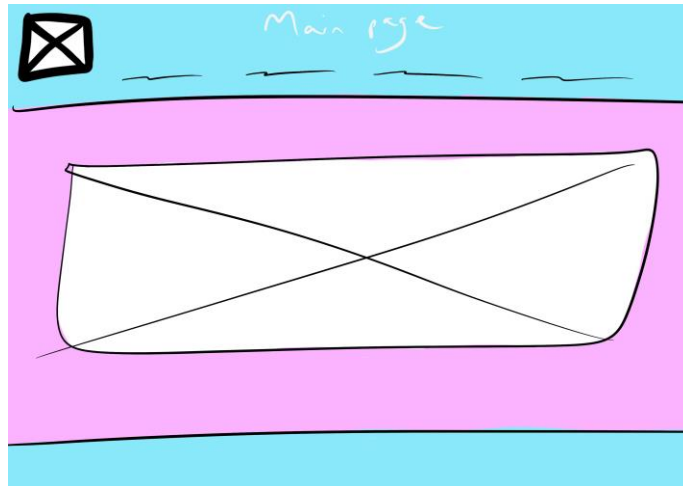

The main page I had issues within terms of the main image. Everything I tested overwhelmed the screen when first clicking. I chose a more neutral image and scaled it down, then I drew some flowers to frame it. This made the page look a lot cleaner and drew the eye more naturally to the places it needed to be.

For the digital, traditional, icons and college pages I followed the same structure. Title the images, then title the images and so forth as many as needed. I chose this to break the images down further so that it looked less like a block and more cohesive. I also tried to make the images visually flow, making sure the colours of the images around each one visually flowed. I used a mix of personal projects, college projects and work I did for others for the images.

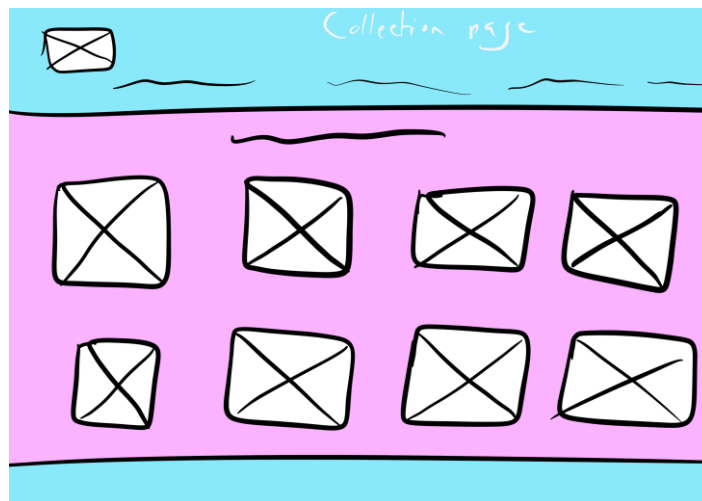

After I had most of the website done, I had multiple people have a look at my website. The feedback I received was about the header. There was not enough contact between the colour of the words and the background. So, I darkened the letters. I also got feedback on the image on the main page which I changed to the current one.

Below I have the wireframes of the website before I started working on it.
